

# autoHTML

## Export your Layout into HTML...

With autoHTML you can export articles from one or more XPress files as HTML files, which can be used as a basis for publishing text on the World Wide Web. You can export only text without images and layout elements. After exporting, the text is displayed in a browser using previously assigned HTML styles.

A preset lets you specify which part of a document is exported, how the style sheets of a document are treated and how the text is formatted in the HTML file. Create, edit and customize as many presets as you like.

When exporting articles manually with autoHTML, articles from the currently open document will be exported. Articles can also be exported automatically using the AutoPilot XT of callas software. In combination with QPS, the Quark Publishing System, you will then be able to export any article in your publication.
