ChangeJobName

Renaming of PostScript jobs

The QuarkXTension ChangeJobName renames your PostScript jobs before the output. Not only the file name is changed, but also the job name within the postscript file. This is ideal for imposition.

Convenient for

- generating PostScript data and giving it a meaningful job name outward
- hotfolder being supplied over printer queue
- every way of postScript output over queues
- the supplying of imposition software, within the own workflow as well as for an output to third parties

While printing with registration marks the new jobname and the original name of the document will be printed on the film or other output medium.
