CopyBridge/W

Automated import and export of RTF files

CopyBridge/W reads and writes RTF files, for example in Word, Word for Windows or WordPerfect. For the export it is possible to export all QuarkXPress formattings with new technologies ("hidden tags") at once and, even if there is visible only 12 pt Helvetica, to reimport the complete text after correction with all formats again. An automated ("Hot") import/export is available to display divisions and alignment generated in QuarkXPress afterwards identically in a word processing software. At the same overset or underset will be shown. An allocation from PC fonts to Mac fonts can be done from the user (preferences). We can adapt possibly different fonts. Includes CopyFlow.
