

# CopyFlow

## Batch Import/Export from/to QuarkXPress

CopyFlow adds batch import and export tools to QuarkXPress. CopyFlow enhances QuarkXPress in workgroup publishing environments by providing a method to speed page assembly through its ability to assign names to QuarkXPress document boxes, to associate them with the story and art files on disk, and to carry out the batch operations of import, export and flush. All or any text and graphic files within a document can be batch exported, and then re-imported after revision with one command. Even if contributing editors use different word processors, CopyFlow remembers a file's native format or permits you to export all files in a document in one format. All QuarkXPress word processor and graphic formats are supported.
