

ex FrameEditor

Make your own PostScript frames in QuarkXPress!

Create real PostScript frames in QuarkXPress. This XTension lets you create real PS frames in a snap and set up your own individual libraries, i.e. for individual publication sections, different customers or any other re-occurring requirement. Each corner or radius and side of a frame can separately be defined in a palette. The frame can be previewed in this palette prior to application to a box in the document. A frame can consist of 1 – 3 different layers. You are able to print out a report sheet directly from the palette to get detailed information about the frame configuration to keep on file. Because the frames created in the XTension are PostScript, the output is PostScript quality and scalable (announced).
