

ex Geometry

Make your article geometries in CopyDesk and then automatically take them over into the QuarkXPress layout

ex Geometry lets you already define and change required geometries right in a Quark CopyDesk article. Parameters, i.e. height, column number, width and gutter can be set right at the editors workstation. Settings for headline, sub-line and copytext are separately defined and are automatically taken over by the QuarkXPress layout. Presently available in 68k. The QuarkXPress version saves geometries defined in a CopyDesk article in the layout. Can be individually customized.
