

# FlexScale

Allows a document to be scaled when sent to a printer

If you need help with flexographic output from QuarkXPress, FlexScale is there. FlexScale lets you scale a document as it is output to a printer or other device. The vertical and horizontal scaling percentages are independent of each other so that a document may be scaled vertically and/or horizontally. The XTension scales printed output between 50 percent and 150 percent, and you can specify decimal percentages for precision scaling of all your flexographic work.

FlexScale integrates the FlexScale interface into the QuarkXPress print dialog.
