

FontFetch

Loads automatically all in a document used fonts

Font Fetch works in conjunction with Suitcase 3.0.x from Symantec to streamline your workflow by keeping track of all your fonts, automatically opening only those fonts you need for each XPress document as you open it. Based on preferences you set, it will also automatically close these fonts when you close the document. Font Fetch also takes over the Missing Fonts function from QuarkXPress, quits Suitcase after performing font open/close operations to save memory for other applications, and enables or disables the Replacement Font function. Disabling the Replacement Font function allows documents to open in 20-30% of the time it would normally take a document to open (you will receive a reminder to use Font Usage to search for and replace missing fonts). The features provided by Font Fetch will help you power through the routine tasks of font management.
