

fXT

creates footnotes in QuarkXPress

fxt automates the placement and numbering of footnotes within Quark XPress documents. The XTension uses footnote references that are tied to corresponding footnotes with hidden markers. References can be marked interactively within XPress with the fXT floating palette or with markup codes placed in the text either before or after importing text into XPress. Using [ex RTF Filter](#) with the fXT you can import footnotes directly from word processors i.e. MS Word Mac or Windows via the RTF format.
