

# OPI Swapper

swaps OPI layout data for OPI high-resolution data and vice versa

OPI\_Swapper provides you with an overview of all picture frames in the document , with information of the current picture status, the paths to the low and high-resolution data and information on which files are actually available and which ones are missing.

After a document-wide picture swap, a swap log is issued which shows this information.

OPI\_Swapper quickly and efficiently swaps OPI layout data for OPI high-resolution data and vice versa, and swapping is possible for several documents at once, for a complete document or by frames. As needed, low or high-resolution data can be loaded by a mouse click in documents.

You define your Helios Ethershare setting and assign picture comments in the preferences. The data entered here are allowed for in low and high-resolution data interchange
