

PDF Inspektor

Preflighting for pdf documents

Preflighting is one of the most important work procedures in each production process. The new version 2.0 of the pdfinspector analyzes up to 400 different details of pdf documents. Pre-defined test profiles for standard checks are contained in the program. Non-standard profiles can be created, stored and applied by the user at any time. The test report is displayed to the user in a tree structure, and also to detail specification to sources of problems are not missing. Apart from the gold edition, which offers unrestricted test functions, there is still the platinum edition, which also supplies unrestricted correction functions apart from the check. The autoedition contains an automatic checking and correcting of files. The latter needs however the program autopilot.
