

TeXTractor

Enhanced options of exporting text out of QuarkXPress

TeXTractor is the comprehensive text extraction XTension for QuarkXPress. With this XTension, you can export all of the text in a document or selected portions of the text using any filter currently available to QuarkXPress. You can export only text that has a particular style sheet applied to it, or only text that was brought into QuarkXPress by being imported. You can even choose which stories should be exported from a document and rearrange the order in which they are exported.

The extensive TeXTractor preferences make it easy to indicate a "page area," outside of which no text exports, or you can have TeXTractor place markers in the exported text to indicate the beginning and end of stories, as well as on what page numbers the stories were found in the original document.

TeXTractor also offers batch processing mode, enabling you to export text from a number of QuarkXPress documents in one step. The XTension exports text found in one folder or an entire list of folders. You can even time-delay text extraction sessions so that they run unattended. Time-delayed text extraction may run once a day at a certain time, or at intervals throughout the day.
