

CPSI Fixer

EPS printing problem

CPSI Fixer is QuarkXTensions software that should correct a printing problem you may have experienced when using QuarkXPress™ and certain affected PostScript Level 2 configurable PostScript interpreter printers. When this problem occurs, a portion of an imported EPS that is cropped by the picture box on the screen display does not crop on the printed output. While the software is designed primarily to resolve EPS clipping problems, it should fix clipping problems you may experience with other graphic formats. (Freeware)
