

ex WireImporter

Import of newswires into a database / editorial system

The application ex WireImporter watches folders filled by **ex GetWire** (or other applications) and transfers the data into the database (QCM, LotusNotes oder SQL).

The files get a separate class type to simply divide newswires from other ASCII files.

ex WireImporter also administers user profiles, i.e. queries or the users workspace. During the import of the newswires each single newswire will be checked against all ticker queries. The user receives update wires automatically. The wires will be put into the users basket. So a "forward search" can be realized and be used as ticker.
