

FCSTableMaker

Generates stylesheets for easy tables in QuarkXPress

FCS Table Maker is a collection of functions designed to facilitate the production of simple tables of data in QuarkXPress. Though succinct in function, FCS TableMaker provides a large portion of the functionality needed by most users. The XTension includes functions for building grid lines, establishing an exact center on a page, building a grid of either text or graphics boxes, and several tab functions. TableMaker also contains a function for creating grouped sets of horizontal and vertical rules, using the default rule style set for the orthogonal line tool in the QuarkXPress tool palette. Additionally, "Create Style Sheet" will define a new text style with the name you select, and apply all tab settings built in TableMaker.
