

FindFile XT

Comfortable search utility for pictures on servervolumes

This XTension quickly restores file path information for graphic files so lost file links can be updated. When you provide the XT a starting point on the network, it automatically searches through the hierarchy of numerous folders to find each graphic and attach the correct file path. Some of the features: restores lost links after graphic or document relocation, shows where paths break down, lists image information e.g. name and creation date, modification date, on-page location and file type, permits entry of file suffix, i.e. .eps to be append.
