Hidden XT

Embeds SGML-Tags in QuarkXPress text

hiddenXT is an XTension to QuarkXPress allowing you to embed arbitrary text strings such as SGML tags in a QuarkXPress document for later retrieval and export. It doesn't rely on QuarkXPress Style sheets or other tricks in a effort to encode the tags. The actual tags are embedded in the text and can be viewed during the production cycle if desired. Once the production cycle is complete the tags can be restored prior to export and archival.
