Moonshine

Batch import of images

Have you ever tried to batch re-import images into multiple documents without loosing position/scale/crop/rotation settings? Have you ever had to find all TIFF images imported from a set of folders and replace them with EPS images from another folder? Exit Picture Usage and enter Moonshine, the power of OPI, without the expense.

Moonshine is a QuarkXPress XTension that allows batch reimporting of images into any number of documents. After scanning and analysing the documents, Moonshine allows you to redefine any image access path; a series of search and replace tools allow you to act on files within certain folders, specific file types, or even simply remove filename extensions! And the importing process preserves all image settings such as position, scale, rotation, etc.
