

TableWorks

A powerful chart editor in QuarkXPress

Extends QuarkXPress with a powerful chart editor module. Completely integrated in QuarkXPress, all cells (QuarkXPress frames) can be formatted as ever desired. Line thickness and background areas, text flow within a chart and many other features can be configured optionally. Once a baseline grid has been configured and text attributes are defined, these can be saved for later use. The size of a cell grows with text input, if required.

Charts can be created over several pages. Formats can be changed in the whole chart or in specified areas. You can also work with style sheets, which you may apply as often as desired. Cells can be even rotated or skewed within a chart to get clearly arranged title bars. Charts from Microsoft Excel can be taken over as ASCII text.
