TextPorter

TeXTporter text manager provides extended text management functions for QuarkXPress

The "Load text" and "Save text" standard functions are not the ultimate solution for many tasks. TeXTporter takes an approach to this problem which could be referred to as "text-document connection".

TeXTporterhas its own Load text and Export text functions for this purpose.

If a text is loaded or exported with TeXTporter , a connection is established between the text frame and the export file. You con now verify whether the export file and the text loaded in the document still correspond. If changes have been effected, one option is to update the document from the text file, the other is to retrace the document changes in the text file.

This provides a tool which facilitates the exchange and administration of texts among layout people and compositors on the one hand, and editors, copy writers and translators on the other.

TeXTportercan export all text frames for an entire document or a selected text frame Consequently, one single command makes all texts - even those from very large documents - available for sharing.

The XPress document and any texts edited externally can be matched in a bidirectional manner. The " Back " function gives the user full control of the matching process. The last step can be undone.

Due to its well thought-out concept and the clear structure of the interface, TeXTporter quickly provides clarity and productivity in the "text jungle".
