Touch

provides a bridge between Fetch and QuarkXPress

Touch is an XTension to QuarkXPress that provides a bridge between Fetch and QuarkXPress by allowing the user to import graphics, text files and QuarkXPress documents from a Fetch catalog into a specialized library, visually similar to QuarkXPress' own libraries. Touch permits Touch Libraries to be created in a number of different ways. Touch uses the Macintosh Clipboard to transfer Fetch references from a Fetch catalog to a Touch library with thumbnails intact. All graphics, text files and QuarkXPress documents contained in a folder may be added to a Touch Library automatically by selecting Append from Folder. Alternatively, any or all graphics in an QuarkXPress document may be placed in a Touch Library with the Import from Document command.
