

Treasure Pro XT

creates and manages enhanced image catalogs in QuarkXPress

Looking for the easiest way to automate the production of your XPress documents? Try Treasure Pro. First you automatically create your favorite image catalog by scanning hard drives, folders, or XPress files for images (alternatively, you import ASCII-delimited database output). Now you can enjoy viewing and browsing your image catalog right within QuarkXPress and drag them onto XPress pages. Ready for the real time savers? Publish complex pages or your entire XPress files automatically by pulling both image and text data from the Treasure Pro image catalog — all without needing to use esoteric database tags. Treasure Pro is an asset management database and versatile catalog publishing system all in one.

TreasurePro XT imports the following picture formats: EPS, TIFF, PICT, GIF, JPEG, Scitex, Photoshop, PhotoCD, QuickTime. Picture formats saving metadata like object descriptions or catchwords (e.g. TIFF) import these automatically as text files into the catalog.

Each picture can be placed manually into the QuarkXPress layout with the mouse. For this operation a standard size can be assigned. It can be defined over the presets if a picture fits to the frame or the frame to the picture size and on which position within the frame a picture shall be positioned. TreasurePro XT catalogues can be exported in the following formats:

- a) as a new TreasurePro XT catalogue
- b) as a tab delimited text including all information as catchwords or classifications
- c) as HTML including image conversion as GIF or JPEG
